# **Experiment – 1 b:** TypeScript

Name of Student	Sonam Chhabaidiya
Class Roll No	D15A_09
D.O.P.	
D.O.S.	
Sign and Grade	

**<u>AIM</u>**: To study Basic constructs in TypeScript.

#### **OVERVIEW OF TASKS PERFORMED:**

The experiment demonstrates inheritance, method overriding, and composition in Java and interface implementation in TypeScript. A Student class was extended by GraduateStudent, overriding getDetails(), while LibraryAccount was independently associated with Student, showcasing composition. In TypeScript, an Employee interface was implemented by Manager (with department) and Developer (with programmingLanguages), both overriding getDetails(). Instances were created to observe behavior.

# <u>OUTPUT</u>

(a) Student and GraduateStudent with Composition

```
    PS C:\Users\PC\Desktop\TYPESCRIPT> tsc graqde.ts
    PS C:\Users\PC\Desktop\TYPESCRIPT> node graqde.js
    Name: Sonam, ID: S12345, Grade: B
    Name: Sonam, ID: G12345, Grade: A, Thesis Topic: Machine Learning
    Thesis Topic: Machine Learning
    Account ID: L123, Books Issued: 5
    Name: Sonam, ID: S12345, Grade: B
    Account ID: L123, Books Issued: 5
```

This screenshot displays the output of the TypeScript program implementing inheritance

and composition. The program first prints details of a **Student** and a **GraduateStudent**, demonstrating method overriding and inheritance. Then, it prints the **Thesis Topic** of the GraduateStudent separately. The next lines show details of a **LibraryAccount** associated with a student, demonstrating composition. Finally, it displays a combined output of both **Student and LibraryAccount**, showcasing how composition works.

# (b) Employee Management System

```
PS C:\Users\PC\Desktop\TYPESCRIPT> node employee.js
Name: Sonam, ID: M001, Role: Manager, Department: HR
Name: Barkha, ID: D001, Role: Developer, Programming Languages: JavaScript, TypeScript, PythonPS C:\Users\PC\De
p\TYPESCRIPT> []
```

This screenshot displays the output of the **Employee Management System** program. It shows details of an **Employee interface**, with two classes: **Manager** and **Developer**, implementing it. The output displays the details of a **Manager** named Alex, including their ID, role, and department. It also shows the details of a **Developer** named Anuprita, including their programming languages. The output is generated after running node <code>src/employee.js</code> in the terminal.

# **CONCLUSION**

This experiment demonstrated the fundamental concepts of TypeScript, such as inheritance, method overriding, and composition through the implementation of **Student** and **GraduateStudent** classes. Instead of using inheritance, composition was demonstrated by linking **LibraryAccount** with **Student**, emphasizing flexibility in design.

Furthermore, the **Employee Management System** utilized interfaces to enforce structure and type safety, highlighting the advantages of TypeScript in maintaining scalable and well-organized code. Overall, this experiment reinforced the benefits of TypeScript's object-oriented capabilities, improving code readability, reusability, and reliability.
